✓ Catalytic hydrogenation of acetaldehyde in the gas phase.
 Imre Pástorhy, Miklós Bakos, and Károly Schügel
 (Szerves Vegyipari Kutató Intézet, Budapest). *Vegyipari
 Kutató Intézet Közleményei* 4, 316-22 (1954).—The lab.
 app. consists of a 80 X 1000 mm. steel tube of 5.7 l. vol.,
 having a heat exchange surface of 0.25 cu.m. It is im-
 mersed in a heated Dowtherm bath. Cu deposited on S
 was used as catalyst. The reaction temp. was 100-200°
 and the product consisted of EtOH with a max. of 1% AcH
 0.6% AcOH, and 1% AcOEt. Excess H did not affect the
 reaction. By using a novel calkg. method, the results of
 tests in the lab. reactor were used for the construction of
 a pilot plant size adiabatic exptl. reactor consisting of a 250 l.
 catalyst bed (200 X 4500 mm.). Catalyst particle size
 was 12 mm., insulation was provided by a 70 mm. thick
 stone-felt and a 230 mm. thick glass wool layer. Within
 the reactor 3 evenly spaced thermoelements were fitted to
 enable observation of temp. distribution. G. I. Euzel.

Abstract: New data are presented concerning the correlation
between critical volume (V_c) and molar refraction
(R_D). V_c values are given for 150 compounds, which
were measured and calculated according to the formula:
mula: $V_c = aR_D + b$ (where a and b -- characteristic

constants of individual homologous series); the values of these constants are given for n-alkanes, their mono-, di- and trimethyl-substituted derivatives, n-alkenes, cycloalkanes, alkyl-cycloalkanes, aliphatic alcohols, acids, esters, nitriles, ketones, alkyl chlorides, alkyl sulfides, ethylamines, benzene, alkyl benzenes and phenyl halogens. The relative error of calculation is less than + 2%. The question of additiveness of V_c is considered. A method is proposed for the calculation of V on the basis of structural increments in which provision is made, in the derivation of the increments, for the fact that the volume occupied by individual atoms in the

Title : Study of Copper Catalysts Deposited on a Carrier. I.
Correlation Between Size of Carrier Particles and Reaction Velocity in the Case of Gaseous Phase Hydrogenation.
II. Correlation Between Amount of Catalyst and Velocity of Catalytic Reaction in the Case of Heterogeneous Catalytic Hydrogenation in Gaseous Phase.

Orig Pub : Magyar kem. folyoirat, 1957, 63, No 2-3, 52-56; 56-60

Abstract : I. It was found that velocity of hydrogenation of acetaldehyde (I) in vapor phase (v), over a Cu-catalyst (C), does not depend on changes in dimensions of pumice particles used as carrier, if the amount of C remains constant. The fact that v does not depend upon specific surface of

Abs Jour : Ref Zhur - Khimiya, No 8, 1958, 24250

C indicates, in the opinion of the authors, that v is not determined by diffusion. Energy of activation was determined as being about 14.4 kcal/mole.

II. The degree of conversion (x) and apparent velocity constant of the reaction (k') of hydrogenation of I at 150°, over the C, were measured as a function of the amount of C. The following empirical correlations were derived: $y = a \lg w + b$ (w -- amount of C; $a = 0.32$ and $b = 0.20$, if $y = x$, and $a = -0.07$, $b = 0.177$ if $y = k'$).

TITLE: Indirect determination of uranium in organic solvents

SOURCE: Zhurnal analiticheskoy khimii, v. 20, no. 8, 1965, 820-823

TOPIC TAGS: uranium, titrimetry, organic solvent

ABSTRACT: Sakharov's method of determining uranium (VI) in the aqueous phase, involving reduction with Mohr's salt to U(IV) in phosphoric acid solution then titration with ammonium vanadate in the presence of sodium diphenylsulfonate until a stable violet color appears, was applied by the authors to the determination of uranium in organic solutions. The endpoint was determined with a "Titrigraph" recording compensograph over a range of 1×10^{-1} - 3×10^{-5} mol/l. The effect of the following factors on the accuracy of the analysis were studied: purity and quantity of Mohr's salt, duration of boiling of the solution during reduction, amount of phosphoric acid, and time elapsed between the end of oxidation and start of titration. The possibility of determining uranium was studied in aqueous solutions and kerosene, ethyl ether and ethylacetate, and also in the following extracting agents:

TITLE: Comparison of the gamma spectra from the radiative capture of thermal and fast neutrons

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 44, no. 1, 1963, 3 - 9

TEXT: The gamma spectra arising from the capture of fast and thermal neutrons from a water-moderated uranium reactor in Mn, Co, Fe, Ni, and Cu were studied by means of a scintillation gamma spectrometer with an NaI(Tl) single crystal. To eliminate the gamma background, the sample was shielded on the reactor side by a Bi-Pb-Bi sandwich screen, and the detector by a screen of organic glass and boron carbide. The spectra of all five substances were similar in shape (Fig. 4). The difference in the gamma intensities produced by fast and thermal neutrons is attributed to the effect of P-neutrons. There are 4 figures. J

TITLE: Gamma rays from radiative capture of fast neutrons in manganese and copper

SOURCE: Zh. eksper. i teor. fiz., v. 46, no. 4, 1964, 1163-1168

TOPIC TAGS: Gamma rays, copper, manganese, radiative fast neutron capture, Gamma spectrometry, thermal neutron capture, p n.utron, negative resonance

ABSTRACT: The measurements were made with neutrons from a Van de Graaff electrostatic accelerator (using the $T(p,n)He^3$ reaction) and a single-crystal scintillation γ spectrometer. The purpose of the experiment was to check the variation of the radiative-capture γ -ray spectrum with the variation of the partial cross sections corresponding to different orbital angular momenta. It is shown that, com-

Card 1/5

ACCESSION NR: AP4031132

pared with thermal neutrons, the probability of emission of ~ 8 -MeV γ quanta during the capture of fast neutrons in copper decreases by a factor 4--5. This decrease can be attributed either to the influence of the change of the gamma ray spectrum with the ratio of the (n, γ) reaction in different copper isotopes, to the influence of p-neutrons whose cross section becomes appreciable at neutron energy ~ 50 keV, or else to a negative resonance with ~ 100 eV energy causing the change in cross section of the radiative capture of thermal neutrons in Cu^{63} . The results for manganese show a spectrum that does not depend on the energy for fast neutrons and lies about 4--5 MeV lower for fast neutrons than for thermal ones. "In conclusion, the authors thank I. I. Bondarenko and A. V. Maly*shev for interest and a discussion, L. A. Timokhin and Yu. V. Kulabukhova for adjustment of the 256-channel analyzer, and the electrostatic generator crew." Orig. art. has: 5 figures and 1 table.

TITLE: Gamma-quanta from radiation capture of resonance and fast neutron (a survey)

SOURCE: Voprosy fiziki zashchity reaktorov (Problems in physics of reactor shielding)
sbornik statey, no. 2. Moscow, Atomizdat, 1966, 156-163

TOPIC TAGS: radiative capture, gamma radiation, fast neutron, radiation shielding

ABSTRACT: The authors review the literature published before January 1964 on the spectra of γ -quanta from radiation capture of fast neutrons. The causes for variations in these spectra and the available experimental data are summarized. Requirements are formulated for studying radiation capture γ -quanta from the standpoint of shielding design. All variations in γ -quanta spectra are greatest for the hard radiation region. Where the intensity of the transition to the ground state is high, fluctuations alter the remaining portion of the spectrum. Contrary to expectations the spectra of capture γ -quanta in almost all experiments are practically independent of neutron energy in the 30-500 keV range. The considerable differences between the spectra of capture γ -quanta on various resonances as well as the differences between these spectra and those resulting from capture of thermal neutrons make it necessary to mea-

Card 1/2

L 05056-67

ACC NR: AT6027931

sure the averaged spectra of γ -quanta on several resonances. These measurements should be made with incident neutron spectra of the form $1/E_n$ and with rather thick specimens for averaging with respect to neutron spectra which are close to those established in the material being studied. Much of the literature on the spectra of γ -quanta from capture of nonthermal neutrons has no practical application for comparison of the necessary group spectra of capture γ -quanta since the measurements are qualitative (do not indicate the number of γ -quanta per capture). A table is given summarizing the experimental data on the absolute yield of γ -quanta from radiation capture of neutrons with various energies. Orig. art. has: 1 figure, 1 table, 6 formulas.
